BWA Water Additives Presents High-Performance Desalination Solutions at Water China 2013

BWA Water Additives, the leading global provider of specialty chemicals for industrial water treatment and desalination, will showcase its latest high-performance solutions at Water China 2013, March 4 – 6 in Tianjin, China.

BWA will showcase the latest developments with its Belgard[®] range of antiscalants and Belite[®] antifoaming agents for thermal desalination. These products, which include an enhanced maleate technology, are highly regarded in the thermal desalination industry for ensuring efficient, smooth operation of MSF and MED systems. BWA is also continuing its global rollout of Flocon[®] 885, the industry's first and only highly biodegradable, phosphorus free, and nitrogen free antiscalant for RO membranes. Compatible with all major membranes and having international potable water approvals, Flocon[®] 885 is readily biodegradable in salt water conditions, inherently biodegradable in fresh water conditions, and can be monitored in feed water using just a flourimeter.

Visit the stand A048 to meet BWA's regional business and technical leads. Contact Fubing.Peng@wateradditives.com with questions or to make appointments with BWA during Water China.

BWA Water Additives is a technology-led specialty chemicals company whose only business is providing sustainable solutions to resolve our customers' water treatment challenges.
